

I would like to submit the attached policy change proposal on behalf of the Citizens for a Greener Manchester regarding the CEFIA policy on capping capacity of PV installations they subsidize, and replace that with a policy of installing the maximum capacity possible in every installation and paying the Utility to deliver the excess production to other homeowners who do not have solar access but want to invest in off-site capacity. This makes sense to us because 8 out of 10 homes in Connecticut do not have good solar access, which is a huge limitation to the the growth of distributed power generation in our state. Many more homeowners could gain access to local PV generation by this means and each installation on roofs with good access would be more efficient because the contractor is already set up on the site, and maximizes the utility of his labor force. See attached proposal for details.

Thank you

Gene DeJoannis
